# Simple opponent: each experiment's observed frontier

Ten pilots per panel | Same 100 development scenarios per pilot | Same reward profiles and training budget

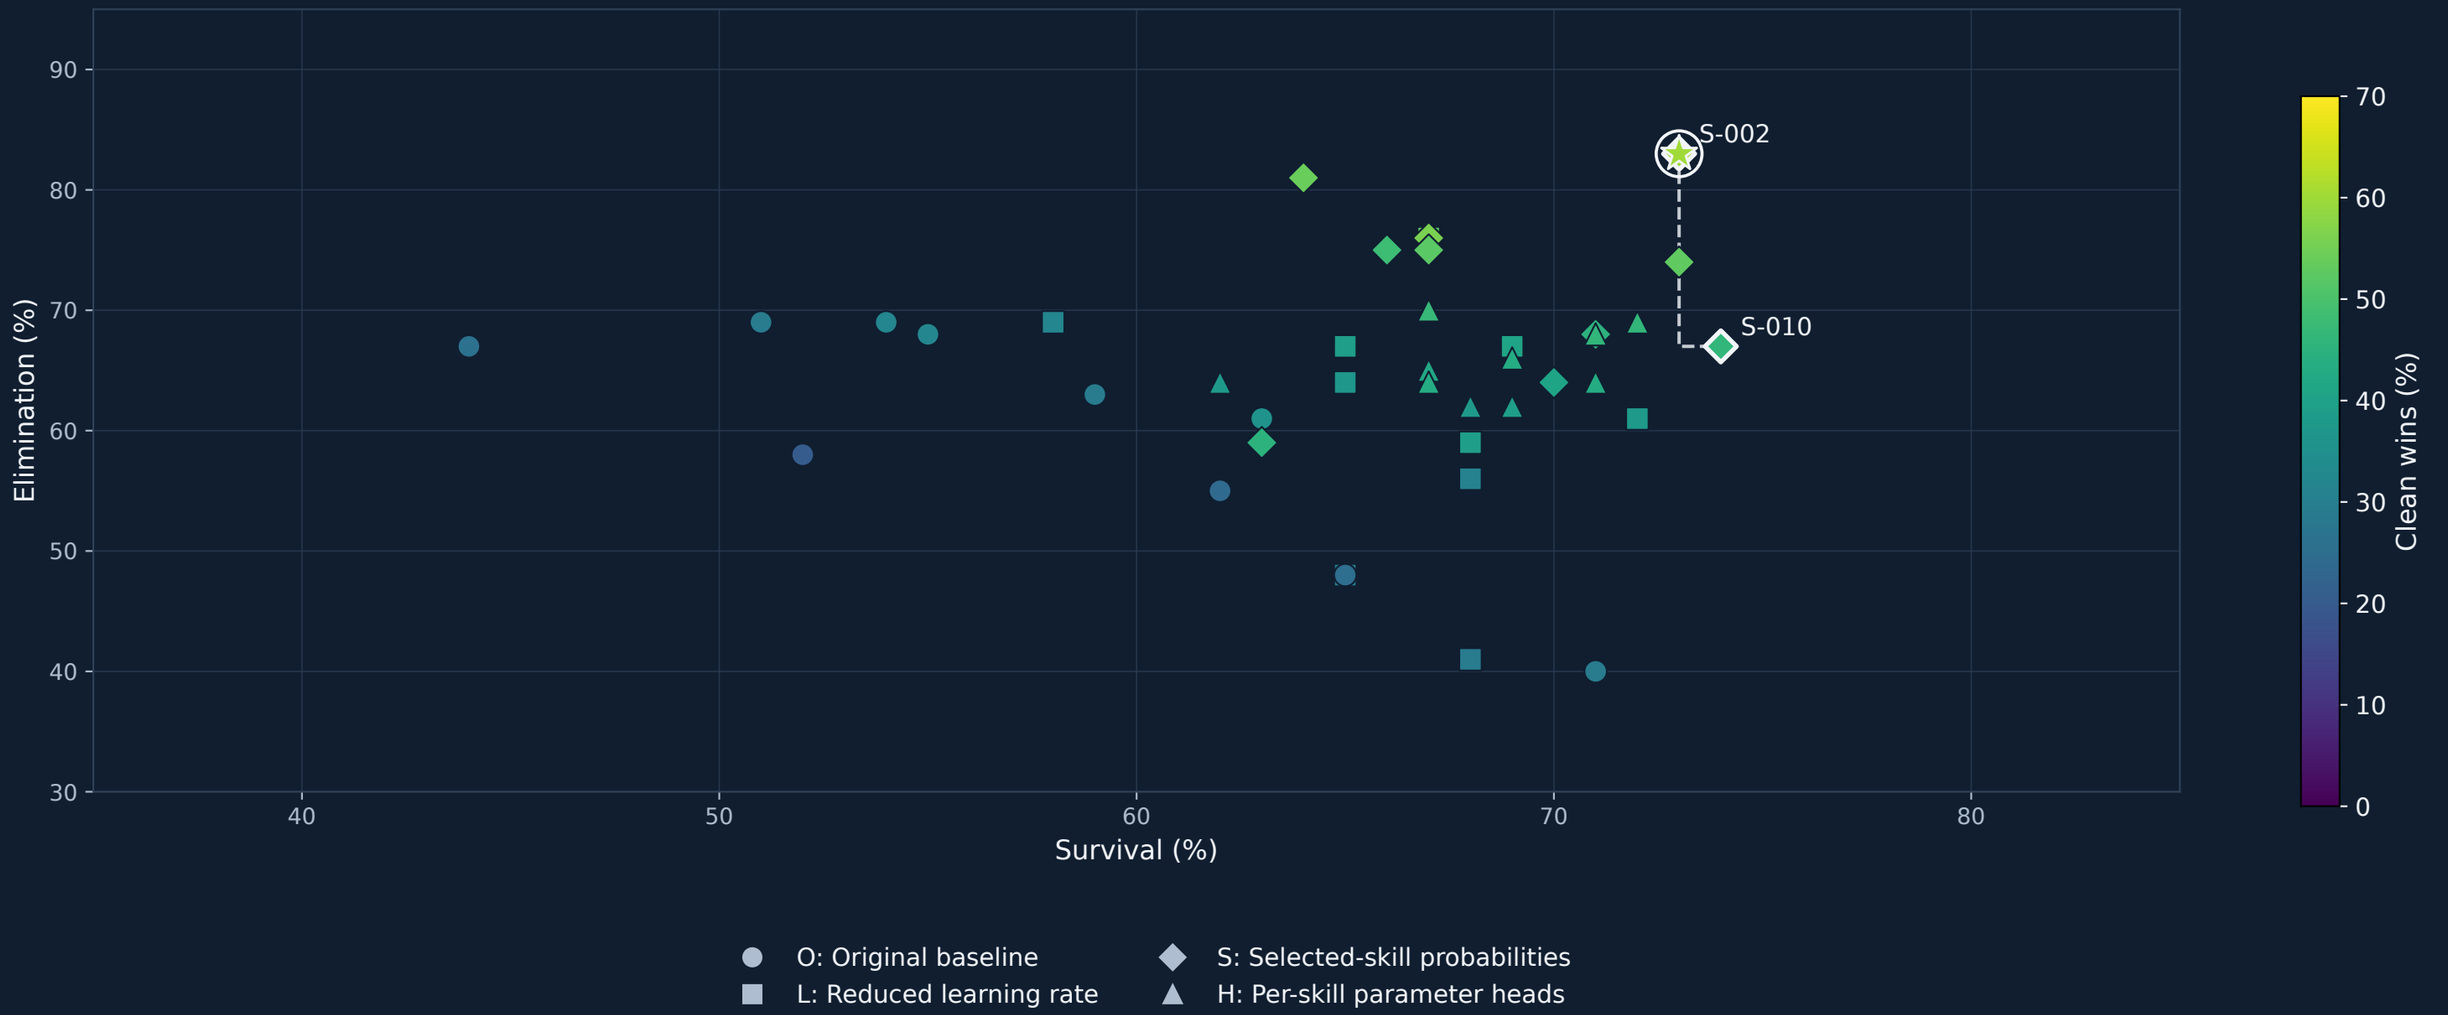

White rings: observed frontier | Star: highest clean-win rate | Better outcomes: upper right

Dashed steps are visual guides, not achievable intermediate policies. Axes are zoomed; use the labelled percentages.

# Simple opponent: all four complete experiments

Forty selected checkpoints | Same 100 development scenarios | One frontier across all candidates

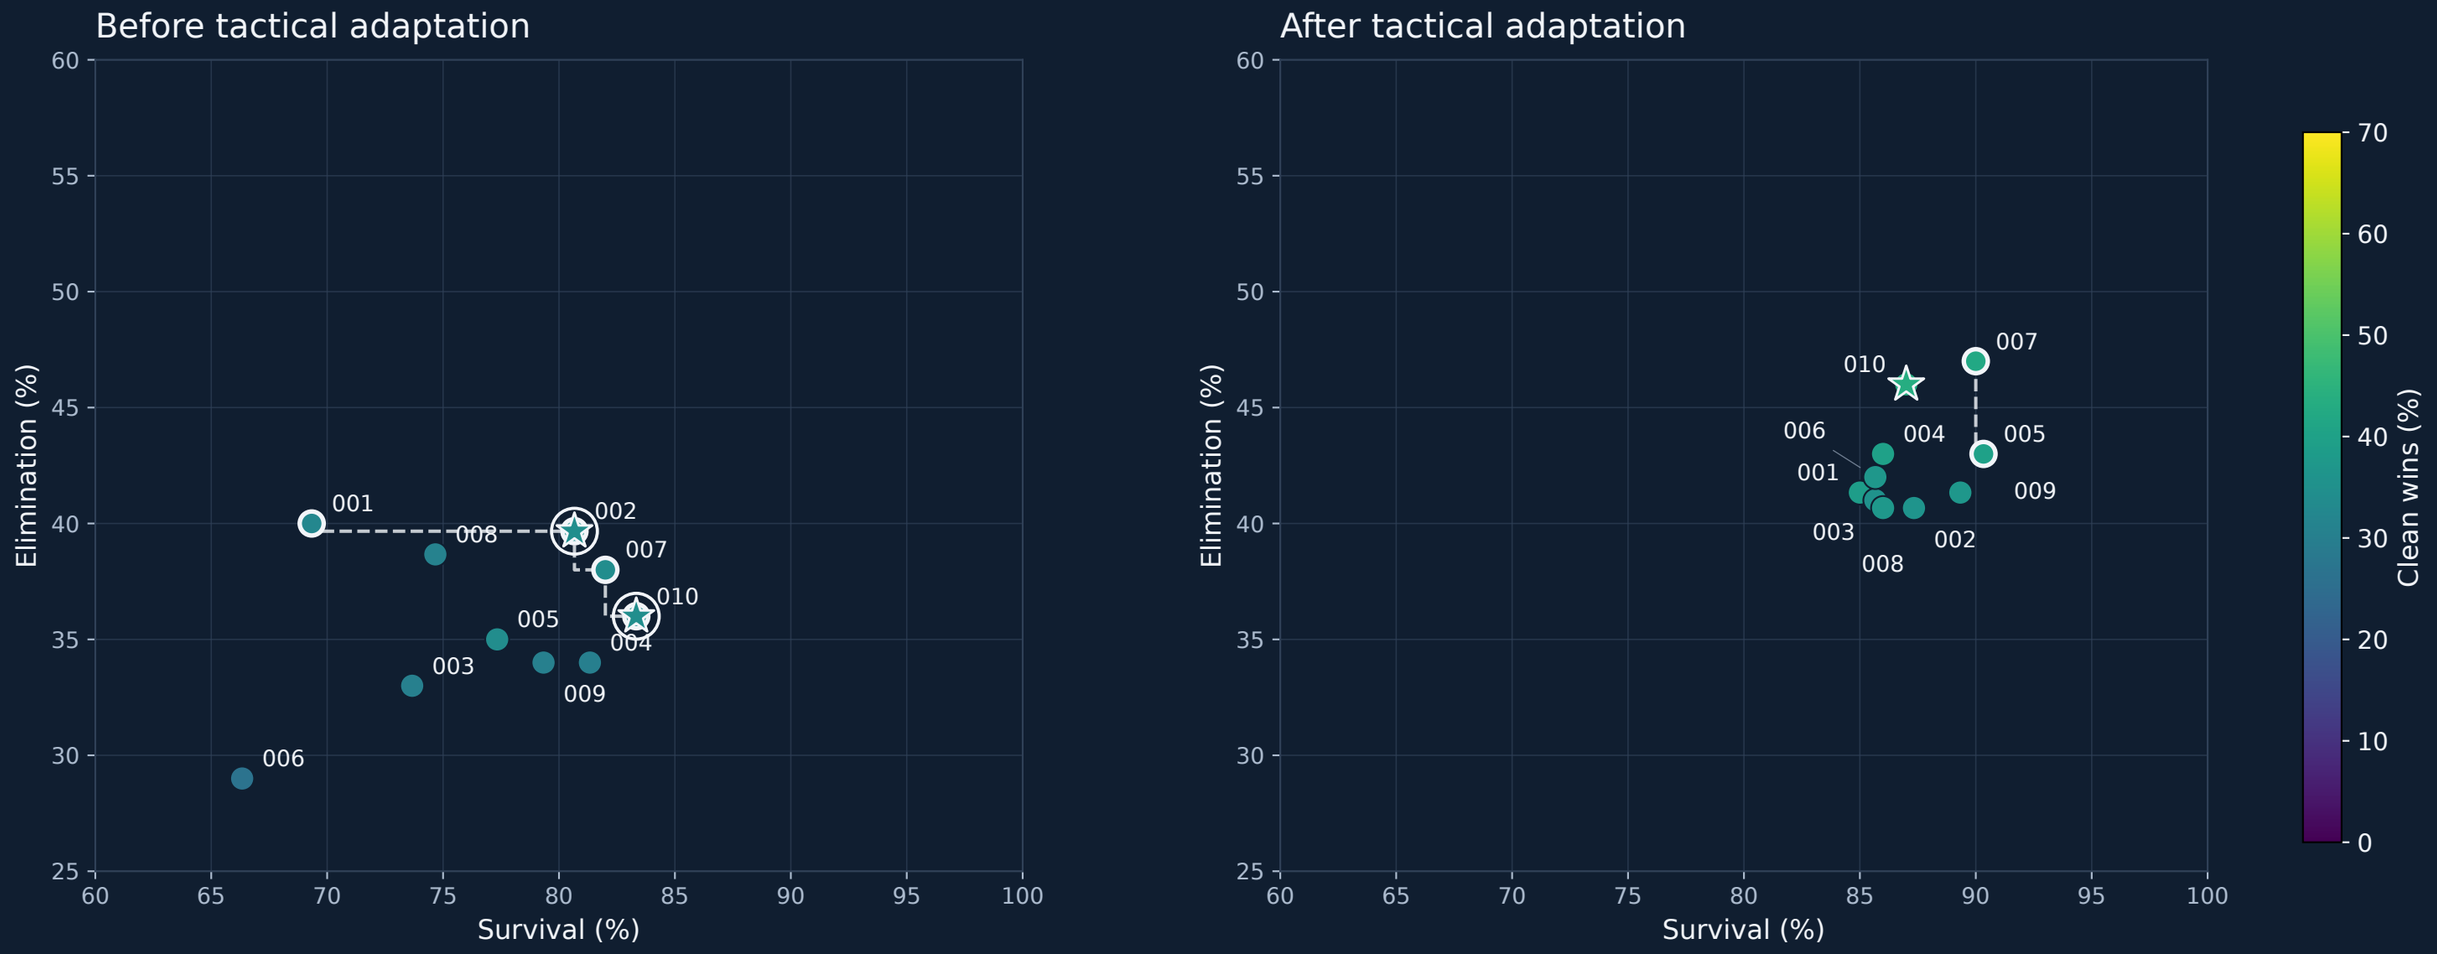

White rings: observed frontier | Star: highest clean-win rate | Better outcomes: upper right

Dashed steps are visual guides, not achievable intermediate policies. Axes are zoomed; use the labelled percentages.

# Tactical adaptation: matched assessment

Ten pilots before and after | Same 300 scenarios per pilot | Frontiers shown separately for each population

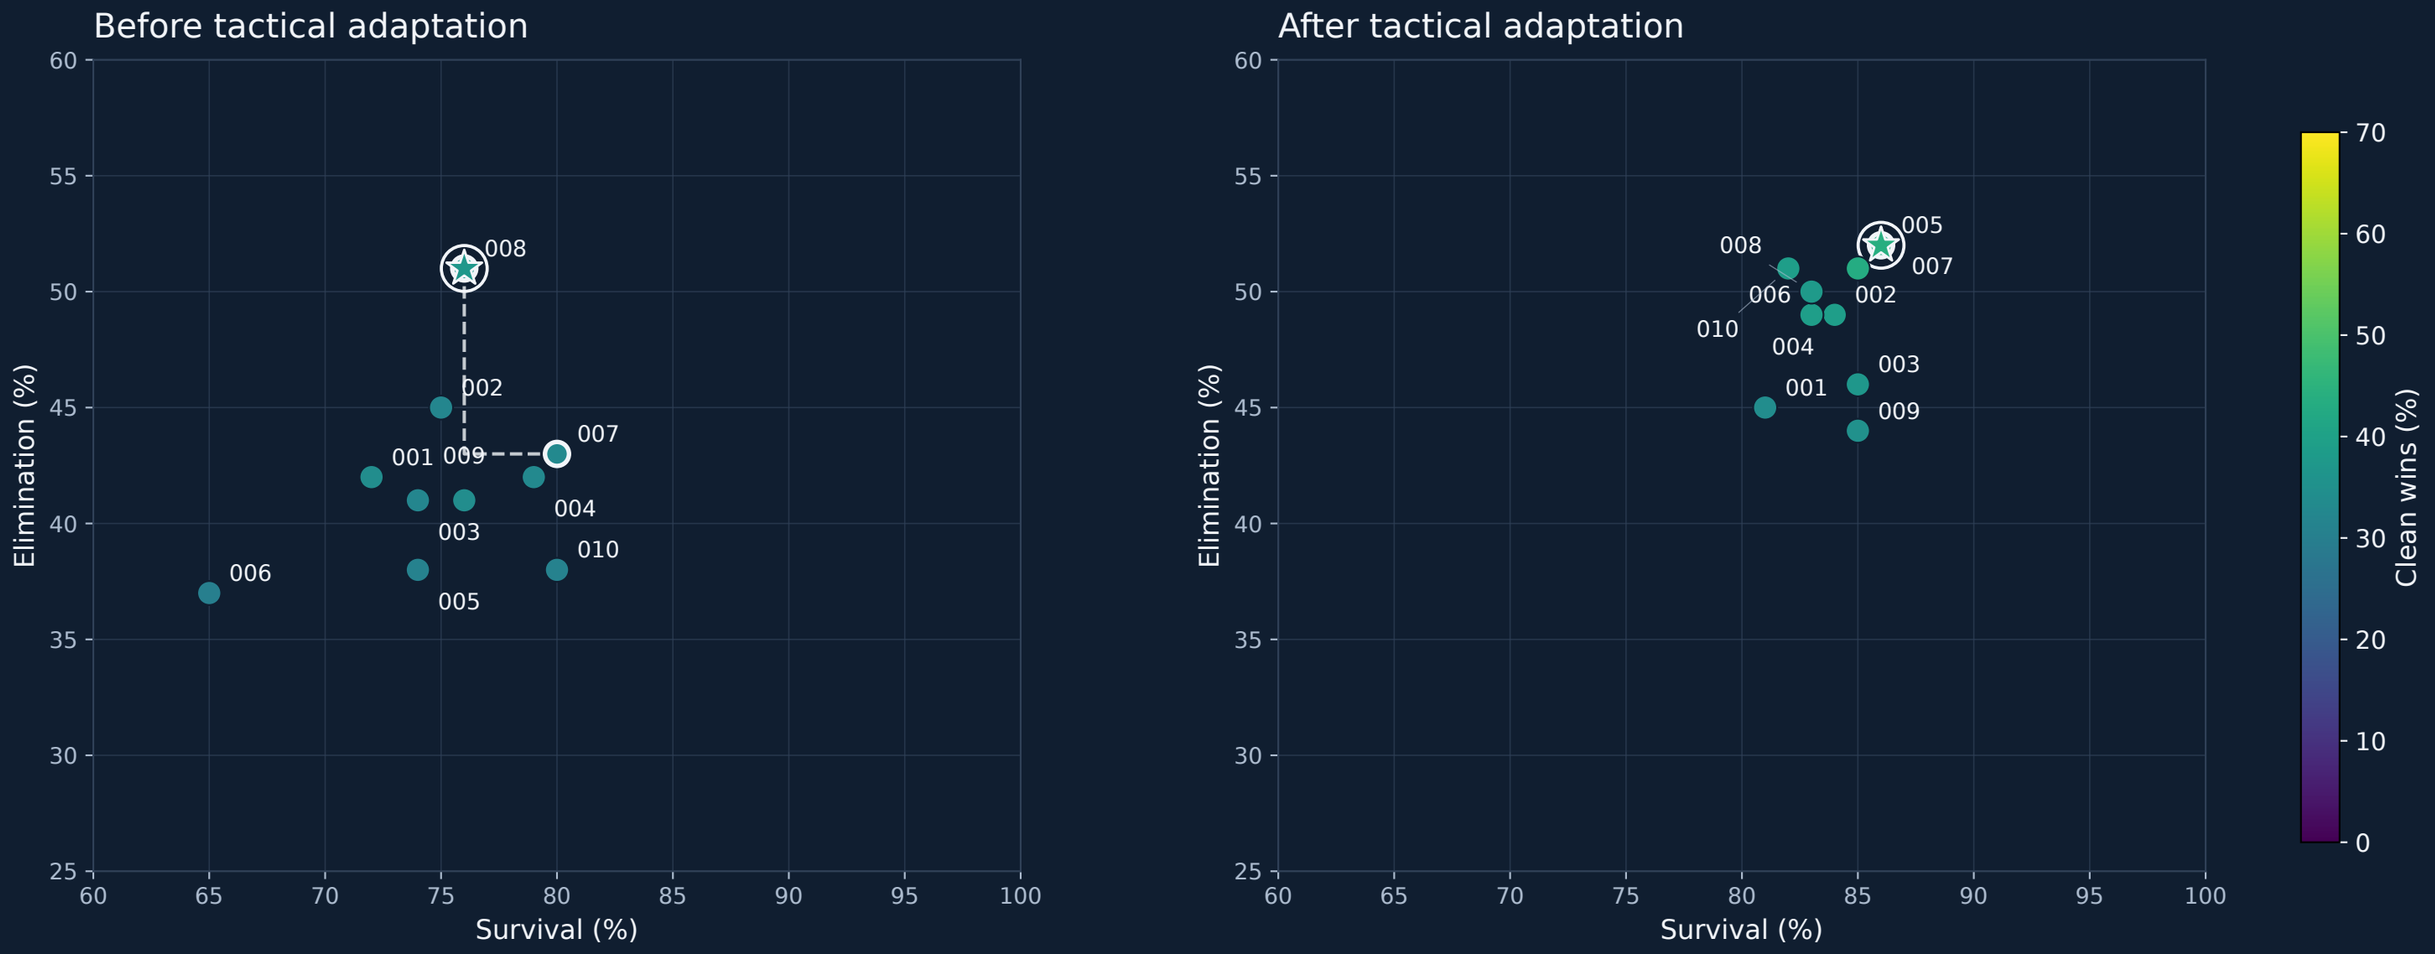

Assessment: pilot 010 has the highest clean-win rate, yet is dominated on survival and elimination.

White rings: observed frontier | Star: highest clean-win rate | Better outcomes: upper right

Dashed steps are visual guides, not achievable intermediate policies. Axes are zoomed; use the labelled percentages.

# Tactical adaptation: historical confirmation

Supplementary evidence | Same 100 scenarios before and after | Different suite from the assessment

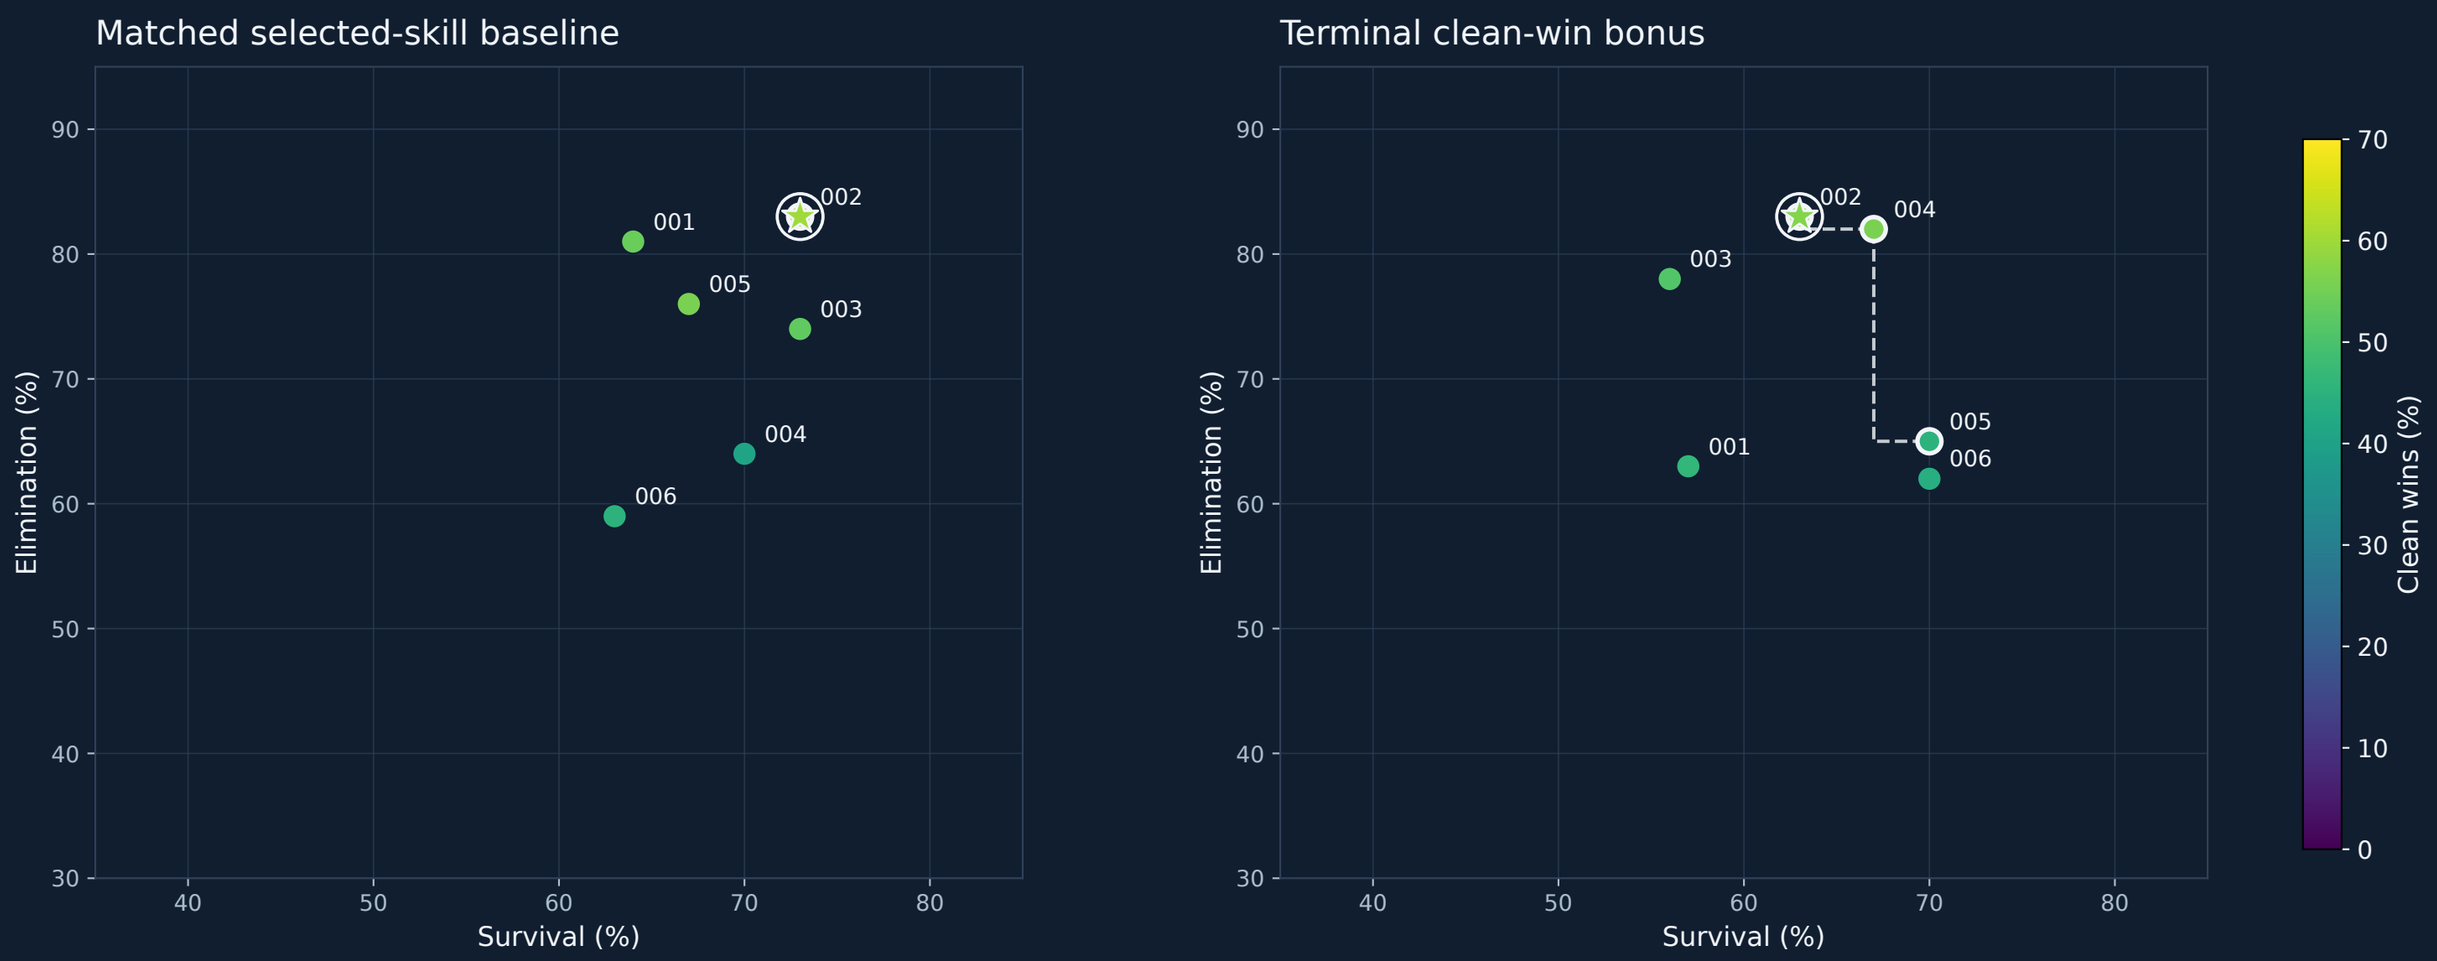

Confirmation: pilot 005 has the highest clean-win rate and is the sole observed after-adaptation frontier point.

White rings: observed frontier | Star: highest clean-win rate | Better outcomes: upper right

Dashed steps are visual guides, not achievable intermediate policies. Axes are zoomed; use the labelled percentages.

# Clean-win bonus: matched six-pilot subset

Incomplete trial: only pilots 001-006 completed | Same 100 development scenarios | No inference about all ten pilots

Population composition is matched within this figure. The bonus trial is excluded from the forty-model comparison.

White rings: observed frontier | Star: highest clean-win rate | Better outcomes: upper right

Dashed steps are visual guides, not achievable intermediate policies. Axes are zoomed; use the labelled percentages.
